DATA SHEET

STK415-090-E — Thick-Film Hybrid IC 2-Channel Power Switching Audio Power IC, 50W+50W

Overview

The STK415-090-E is a class H audio power amplifier hybrid IC that features a built-in power supply switching circuit. This IC provides high efficiency audio power amplification by controlling (switching) the supply voltage supplied to the power devices according to the detected level of the input audio signal.

Applications

- Audio power amplifiers.

Features

- Pin-to-pin compatible outputs ranging from 80W to 180W.
- Can be used to replace the STK416-100 series (3-channel models) and the class-AB series (2, 3-channel models) due to its pin compatibility.
- Pure complementary construction by new Darlington power transistors
- Output load impedance: $R_L = 8\Omega$ to 4Ω supported
- Using insulated metal substrate that features superlative heat dissipation characteristics that are among the highest in the industry.

Series Models

	STK415-090-E	STK415-100-E	STK415-120-E	STK415-130-E	STK415-140-E
Output 1 (10%/1kHz)	80W×2 channels	90W×2 channels	120W×2 channels	150W×2 channels	180W×2 channels
Output 2 (0.8%/20Hz to 20kHz)	50W×2 channels	60W×2 channels	80W×2 channels	100W×2 channels	120W×2 channels
Max. rated V_H (quiescent)	±60V	±65V	±73V	±80V	±80V
Max. rated V_L (quiescent)	±41V	±42V	±45V	±46V	±51V
Recommended operating V_H (8Ω)	±37V	±39V	±46V	±51V	±52V
Recommended operating V_L (8Ω)	±27V	±29V	±32V	±34V	±32V
Dimensions (excluding pin height)	64.0mm×31.1mm×9.0mm				

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Specifications

Absolute maximum ratings at Ta=25°C (excluding rated temperature items), Tc=25°C unless otherwise specified

Parameter	Symbol	Conditions	Ratings	Unit
V _H maximum quiescent supply voltage 1	V _H max (1)	When no signal	±60	V
V _H maximum supply voltage 2	V _H max (2)	R _L ≥6Ω	±53	V
V _H maximum supply voltage 3	V _H max (3)	R _L ≥4Ω	±43	V
V _L maximum quiescent supply voltage 1	V _L max (1)	When no signal	±41	V
V _L maximum supply voltage 2	V _L max (2)	R _L ≥6Ω	±36	V
V _L maximum supply voltage 3	V _L max (3)	R _L ≥4Ω	±29	V
Maximum voltage between V _H and V _L *4	V _H -V _L max	No loading	60	V
Standby pin maximum voltage	V _{st} max		-0.3 to +5.5	V
Thermal resistance	θj-c	Per power transistor	2.1	°C/W
Junction temperature	T _j max	Both the T _j max and T _c max conditions must be met.	150	°C
IC substrate operating temperature	T _c max		125	°C
Storage temperature	T _{stg}		-30 to +125	°C
Allowable load shorted time *3	ts	V _H =±37V, V _L =±27V, R _L =8Ω, f=50Hz, P _O =50W, 1-channel active	0.3	s

Electrical Characteristics at Tc=25°C, R_L=8Ω (non-inductive load), R_g=600Ω, V_G=40dB, V_Z=15V

Parameter	Symbol	Conditions *1						Ratings			unit
		V (V)		f (Hz)	P _O (W)	THD (%)		min	typ	max	
Output power	P _O (1)	V _H V _L	±37 ±27	20 to 20k		0.8		50			W
	P _O (2)	V _H V _L	±30 ±23	1k		0.8	R _L =4Ω		50		
Total harmonic distortion	THD	V _H V _L	±37 ±27	20 to 20k	50				0.4		%
Frequency characteristics	f _L , f _H	V _H V _L	±37 ±27		1.0		+0 -3dB	20 to 50k			Hz
Input impedance	r _i	V _H V _L	±37 ±27	1k	1.0				55		kΩ
Output noise voltage *2	V _{NO}	V _H V _L	±45 ±30				R _g =2.2kΩ			1.0	mVrms
Quiescent current	I _{CCO}	V _H	±45				R _L =∞			30	mA
		V _L	±30							100	
Output neutral voltage	V _N	V _H V _L	±45 ±30					-70	0	+70	mV
Pin 17 voltage when standby ON *7	V _{ST ON}	V _H V _L	±37 ±27				Standby		0	0.6	V
Pin 17 voltage when standby OFF *7	V _{ST OFF}	V _H V _L	±37 ±27				Operating	2.5	3.0		V

[Remarks]

- *1: Unless otherwise specified, use a constant-voltage power supply to supply power when inspections are carried out.
- *2: The output noise voltage values shown are peak values read with a VTVM. However, an AC stabilized (50Hz) power supply should be used to minimize the influence of AC primary side flicker noise on the reading.
- *3: Use the designated transformer power supply circuit shown in the figure below for the measurements of allowable load shorted time and output noise voltage.
- *4: Design circuits so that (|V_H|-|V_L|) is always less than 40V when switching the power supply with the load connected.
- *5: Set up the V_L power supply with an offset voltage at power supply switching (V_L-V_O) of about 8V as an initial target.
- *6: Please connect -Pre V_{CC} pin (#5 pin) with the stable minimum voltage and connect so that current does not flow in by reverse bias.
- *7: Use the standby pin (pin 17) so that the applied voltage never exceeds the maximum rating.
The power amplifier is turned on by applying +2.5V to +5.5V to the standby pin (pin 17).
- *8: Thermal design must be implemented based on the conditions under which the customer's end products are expected to operate on the market.
- *9: A thermoplastic adhesive resin is used for this hybrid IC.

Application Circuit Example

Recommended Values for Application Parts (for the test circuit)

Symbol	Recommended Value	Description	Larger than Recommended Value	Smaller than Recommended Value
R01, R02	1.5k Ω	Determine the current flowing into the power switching circuit (comparator), (3mA to 10mA at V_H power switching)	Power holding circuit remains active at lower frequencies.	Power switching circuit activates at higher frequencies.
R03, R04	100 Ω /1W	Ripple filtering resistors (Used with C05 and C06 to form a ripple filter.)	Decreased pass-through current at high frequencies.	Increased pass-through current at high frequencies.
R05, R06	56k Ω	Input bias resistors (Virtually determine the input impedance.)	VN offset (Ensure R05=R18, R06=R19 when changing.)	
R08, R09	4.7 Ω /1W	Oscillation prevention resistor	-	-
R11, R12	4.7 Ω	Oscillation prevention resistor	-	-
R14, R15	560 Ω	Used with R18 and R19 to determine the voltage gain VG. (VG should desirably be determined by the R14 and R15 value.)	Likely to oscillate (VG<40dB)	None
R18, R19	56k Ω	Used with R14 and R15 to determine the voltage gain VG.	-	-
R21, R22	1k Ω	Input filtering resistor	-	-
R24, R26	0.22 Ω ±10%, 5W	Output emitter resistors (Use of cement resistor is desirable)	Decrease in maximum output power	Likely to cause thermal-runaway.
R30	Remarks *7	Use a limiting resistor according to the voltage applied to the standby pin so that it remains within the rating.		
C01, C02	100 μ F/ 100V	Oscillation prevention capacitors. • Insert the capacitors as close to the IC as possible to decrease the power impedance for reliable IC operation (use of electrolytic capacitors are desirable).	-	-
C03, C04	100 μ F/ 50V	Oscillation prevention capacitors. • Insert the capacitors as close to the IC as possible to decrease the power impedance for reliable IC operation (use of electrolytic capacitors are desirable).	-	-
C05, C06	100 μ F/ 100V	Decoupling capacitors. Eliminate ripple components that pass into the input side from the power line. (Used with R03 and R04 to form a ripple filter.)	Increase in ripple components that pass into the input side from the power line.	
C07, C08	3pF	Oscillation prevention capacitor	Likely to oscillate	
C10, C11	0.1 μ F	Oscillation prevention capacitor (Mylar capacitors are recommended.)	Likely to oscillate	
C13, C14	22 μ F/ 10V	NF capacitor (Changes the low cutoff frequency; $ex/f_L=1/2\pi \bullet C13 \bullet R14$)	Increase in low-frequency voltage gain, with higher pop noise at power-on.	Decrease in low-frequency voltage gain
C16, C17	2.2 μ F/ 50V	Input coupling capacitor (block DC current)	-	-
C19, C20	470pF	Input filter capacitor (Used with R21 and R22 to form a filter that suppresses high-frequency noises.)	-	-
C22, C23	100pF	Oscillation prevention capacitor	Likely to oscillate.	
D01, D02	15V	Determine the offset voltage at $V_L \leftrightarrow V_H$ power.	Decreased distortion at power switching time	Increased distortion at power switching time.
D03, D04	3A/60V	Reverse current prevention diodes (FRD is recommended.)	-	-
L01, L02	3 μ H	Oscillation prevention inductance	None	Likely to oscillate.

Evaluation Board Characteristics

[Thermal Design Example for STK415-090-E ($R_L = 8\Omega$)]

The thermal resistance, θ_{c-a} , of the heat sink for total power dissipation, P_d , within the hybrid IC is determined as follows.

Condition 1: The hybrid IC substrate temperature, T_c , must not exceed 125°C .

$$P_d \times \theta_{c-a} + T_a < 125^\circ\text{C} \dots\dots\dots (1)$$

T_a : Guaranteed ambient temperature for the end product

Condition 2: The junction temperature, T_j , of each power transistor must not exceed 150°C .

$$P_d \times \theta_{c-a} + P_d/N \times \theta_{j-c} + T_a < 150^\circ\text{C} \dots\dots\dots (2)$$

N : Number of power transistors

θ_{j-c} : Thermal resistance per power transistor

However, the power dissipation, P_d , for the power transistors shall be allocated equally among the number of power transistors.

The following inequalities result from solving equations (1) and (2) for θ_{c-a} .

$$\theta_{c-a} < (125 - T_a)/P_d \dots\dots\dots (1)'$$

$$\theta_{c-a} < (150 - T_a)/P_d - \theta_{j-c}/N \dots\dots\dots (2)'$$

Values that satisfy these two inequalities at the same time represent the required heat sink thermal resistance.

When the following specifications have been stipulated, the required heat sink thermal resistance can be determined from formulas (1)' and (2)'.

- Supply voltage V_H, V_L
- Load resistance R_L
- Guaranteed ambient temperature T_a

[Example]

When the IC supply voltage, $V_H = \pm 37\text{V}$, $V_L = \pm 27\text{V}$ and R_L is 8Ω , the total power dissipation, P_d , within the hybrid IC, will be a maximum of 55W at 1kHz for a continuous sine wave signal according to the P_d - P_O characteristics. For the music signals normally handled by audio amplifiers, a value of $1/8P_{O \text{ max}}$ is generally used for P_d as an estimate of the power dissipation based on the type of continuous signal. (Note that the factor used may differ depending on the safety standard used.)

This is:

$$P_d \approx 32.0\text{W} \quad (\text{when } 1/8P_{O \text{ max}} = 6.3\text{W}, P_{O \text{ max}} = 50\text{W}).$$

The number of power transistors in audio amplifier block of these hybrid ICs, N , is 4, and the thermal resistance per transistor, θ_{j-c} , is 2.1°C/W . Therefore, the required heat sink thermal resistance for a guaranteed ambient temperature, T_a , of 50°C will be as follows.

$$\begin{aligned} \text{From formula (1)'} \quad \theta_{c-a} &< (125 - 50)/32.0 \\ &< 2.34 \end{aligned}$$

$$\begin{aligned} \text{From formula (2)'} \quad \theta_{c-a} &< (150 - 50)/32.0 - 2.1/4 \\ &< 2.60 \end{aligned}$$

Therefore, the value of 2.34°C/W , which satisfies both of these formulae, is the required thermal resistance of the heat sink.

Note that this thermal design example assumes the use of a constant-voltage power supply, and is therefore not a verified design for any particular user's end product.

STK415-100 Series Stand-by control, Mute control, Load-short protection & DC offset protection application

STK415-100 Series Application explanation

The protection circuit application for the STK415-100sr consists of the following blocks (blocks (1) to (4)).

- (1) Standby control circuit block
- (2) Load short-circuit detection block
- (3) Latch-up circuit block
- (4) DC voltage protection block

1) Standby control circuit block

Concerning pin 17 reference voltage VST

<1> Operation mode

The switching transistor of the predriver IC turns on when the pin 17 reference voltage, VST, becomes greater than or equal to 2.5V, placing the amplifier into the operation mode.

Example: When VST (min.) = 2.5V

I1 is approximately equal to 0.40mA since $VST = (*2) \times IST + 0.6V \rightarrow 2.5V = 4.7k\Omega \times IST + 0.6V$.

<2> Standby mode

The switching transistor of the predriver IC turns off when the pin 17 reference voltage, VST, becomes lower than or equal to 0.6V (typ. 0V), placing the amplifier into the standby mode.

Example: When VST = 0.6V

I1 is approximately equal to 0mA since $VST = (*2) \times IST + 0.6V \rightarrow 0.6V = 4.7k\Omega \times IST + 0.6V$.

(*1) Limiting resistor

Determine the value of R1 so that the voltage VST applied to the standby pin (pin 17) falls within the rating (+2.5V to 5.5V (typ. 3.0V)).

(*2) The standby control voltage must be supplied from the host including microcontrollers.

(*3) A 4.7k Ω limiting resistor is also incorporated inside the hybrid IC (at pin 17).

2) Load short-circuit detection block

Since the voltage between point B and point C is less than 0.6V in normal operation mode ($V_{BE} < 0.6V$) and TR1 (or TR2) is not activated, the load short-circuit detection block does not operate.

When a load short-circuit occurs, however, the voltage between point B and point C becomes larger than 0.6V, causing TR1 (or TR2) to turn on ($V_{BE} > 0.6V$), and current I2 to flows.

3) Latch-up circuit block

TR3 is activated when I2 is supplied to the latch-up circuit.

When TR3 turns on and current I3 starts flowing, VST goes down to 0V (standby mode), protecting the power amplifier.

Since TR3 and TR4 configure a thyristor, once TR3 is activated, the IC is held in the standby mode.

To release the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage (*2) temporarily low (0V). Subsequently, when the standby control is returned to high, the power amplifier will become active again.

(*4) The I3 value varies depending on the supply voltage. Determine the value of R2 using the formula below, so that I1 is equal to or less than I3.

$$I1 \leq I3 = V_{CC}/R2$$

4) DC offset protection block

The DC offset protection circuit is activated when $\pm 0.5V$ (typ) voltage is applied to either "OUT CH1" or "OUT CH2," and the hybrid IC is shut down (standby mode).

To release the IC from the standby mode and reactivate the power amplifier, it is necessary to set the standby control voltage temporarily low (0V).

Subsequently, when the standby control is returned to high (+5V, for example), the power amplifier will become active again.

The protection level must be set using the 82k Ω resistor. Furthermore, the time constant must be determined using 22 μ /22 μ capacitors to prevent the amplifier from malfunctioning due to the audio signal.
