# SERVICE MANUAL

INTEGRATED STEREO AMPLIFIER

## SANSUI AU-919

### SPECIFICATIONS

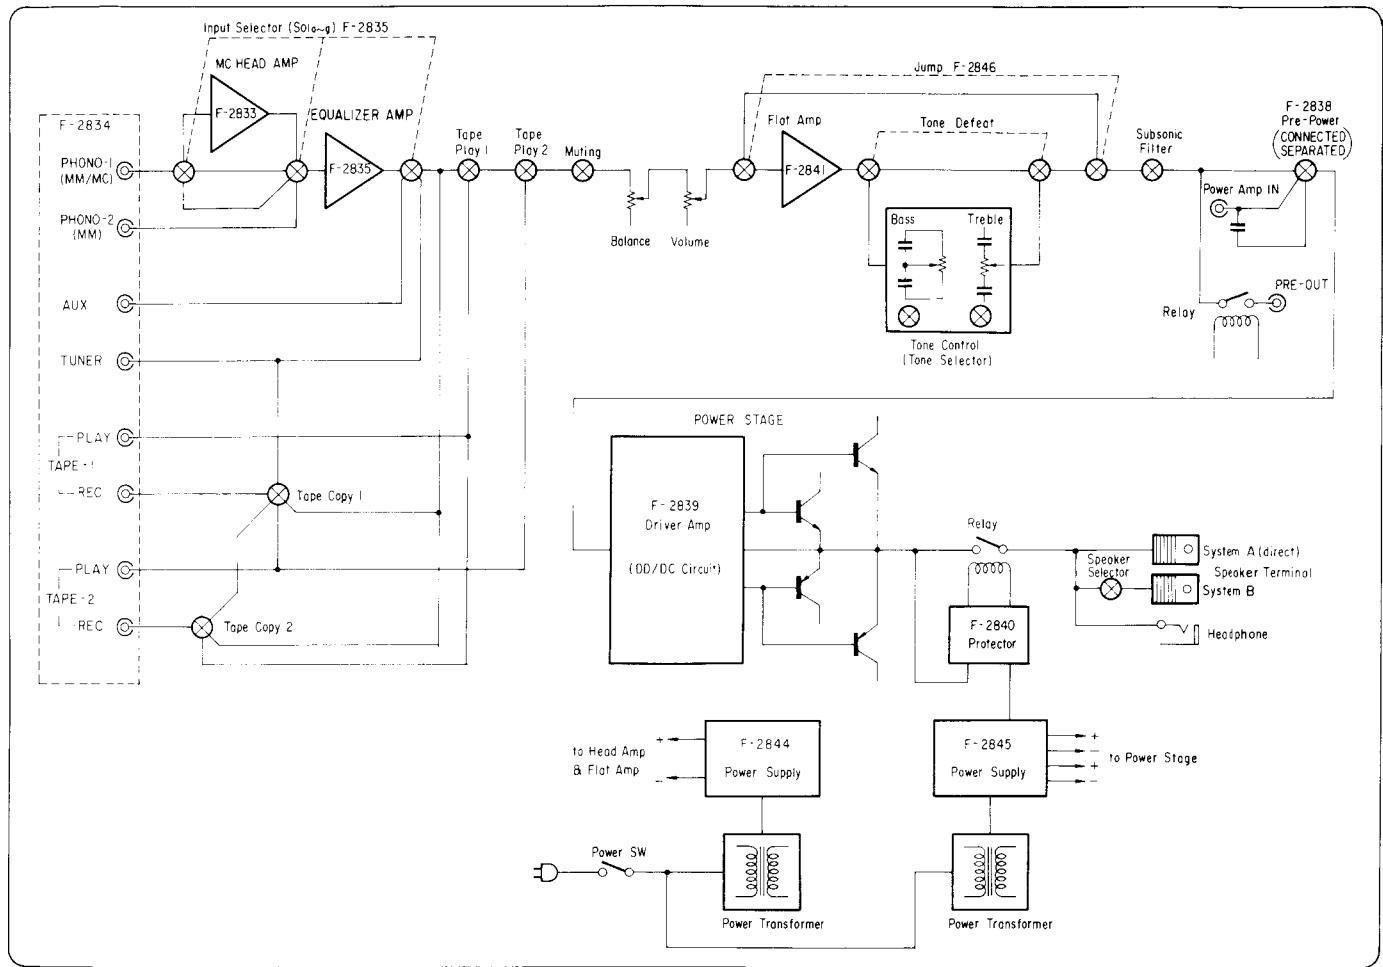

<b>Power output</b>	
Min. RMS, both channels driven, from 10 to 20,000 Hz, with no more than 0.008 % total harmonic distortion	
100 watts per channel into 8 ohms	
<b>Load impedance</b>	8 ohms
<b>Total harmonic distortion (POWER AMP IN)</b>	
.....	less than 0.008 % at or below rated min. RMS power output
<b>Intermodulation distortion (70 Hz : 7 kHz = 4:1 SMPTE method)</b>	
.....	less than 0.008 % at or below rated min. RMS power output
<b>Rise time</b>	0.5 $\mu$ sec
<b>Slew rate</b>	200 V/ $\mu$ sec
<b>Frequency response (at 1 watt) (POWER AMP IN)</b>	DC to 500,000 Hz +0 dB -3 dB
<b>Damping factor (1 kHz, both channels driven)</b>	100 into 8 ohms
<b>RIAA curve deviation (PHONO, 20 Hz to 20 kHz)</b>	+0.2 dB, -0.2 dB
<b>Input sensitivity and impedance (1 kHz, for rated power output)</b>	
<b>PHONO-1 (MC)</b>	0.1 mV/10 ohms (Max. input capability; 30 mV at 1 kHz, less than 0.03 % total harmonic distortion)
<b>PHONO-1, 2 (MM)</b>	2.5 mV/47 kilohms (Max. input capability; 350 mV at 1 kHz, less than 0.01 % total harmonic distortion)
<b>AUX, TUNER, TAPE PLAY</b>	
.....	150 mV/47 kilohms
<b>POWER AMP IN</b>	1 V/47 kilohms
<b>Output level and impedance (1,000 Hz)</b>	
<b>TAPE REC (pin jack)</b>	150 mV into 47 kilohms/600 ohms
<b>PREAMP OUT</b>	1 V into 47 kilohms/1.5 kilohms
<b>Channel separation (1 kHz, at rated power output)</b>	
<b>PHONO-1 (MC)</b>	70 dB
<b>PHONO-1, 2 (MM)</b>	75 dB
<b>AUX, TUNER, TAPE PLAY</b>	
.....	80 dB
<b>Hum and noise (short-circuit, A-network)</b>	
<b>PHONO-1 (MC)</b>	74 dB
<b>PHONO-1, 2 (MM)</b>	90 dB
<b>AUX, TUNER, TAPE PLAY</b>	
.....	100 dB
<b>Controls</b>	
<b>BASS</b>	$\pm 6$ dB (50 Hz)
Tone selector	150 Hz, 300 Hz
<b>TREBLE</b>	$\pm 6$ dB (15 kHz)
Tone selector	3 kHz, 6 kHz
<b>SUBSONIC</b>	-3 dB (16 Hz), 6 dB/oct
<b>MUTING</b>	-20 dB
<b>Power requirements</b>	
<b>Power voltage</b>	100, 120, 220, 240V (50/60 Hz)
<b>Power consumption</b>	
Rated consumption	480 watts
<b>Dimensions</b>	430 mm (16-15/16") W 168 mm (6-5/8") H 428 mm (16-7/8") D
<b>Weight</b>	21.4 kg (47.2 lbs) net 23.8 kg (52.5 lbs) packed

## 1. BLOCK DIAGRAM

## 2. CIRCUIT DESCRIPTION

## 2-1. MC Head Amp and Phono Equalization Circuit

**• MC Head Amp and Phono Equalization Circuit (Refer to Fig. 2-1)**

The circuit configuration from MC head Amp to output of power amp stage used in AU-919 is a fully Push-pull DC amp with direct coupled input-capacitor-less DC amplifier. In order to ignore time constant with lagging or leading phase caused by input capacitor, FET input circuits are employed. By this, higher slew-rate and low-noise factor can be obtained.

1) MC (Moving Coil) type cartridge generally requires head amp to boost up weak signal from the stylus. The pre-amp section of AU-919 includes this head amp and conventional phono equalizer circuit for MM (Moving Magnet) type cartridge. MC type cartridge provides high frequency performance and excellent tonal quality, but as its output voltage from stylus is as low as approx. 0.1mV, the MC head amp or step-up transformer is needed as mentioned above. To ensure the outstanding performance in tone quality and signal-to-noise ratio(S/N), AU-919 employs the head amp which meets with these requirements.

The circuit configuration of MC head amp in AU-919 is input-capacitor-less (ICL) direct coupled complementary circuit using low-noise and high gm FETs of P-ch and N-ch in parallel connection on both channels. The requirements of MC head amp are to provide a enough S/N ratio and gain to connect the MC head amp to conventional phono equalizer. (approximately 28dB for MC cartridge with output impedance, 10 ohms). As high gm can be obtained equivalently by connecting low-noise & high gm FET in parallel, remarkable S/N ratio and gain(gm) can be obtained.

\* The relation between noise and gm of FET is indicated as shown below.

$$em = \sqrt{K \cdot T \cdot B \cdot R}$$

em = Noise voltage  
K = Boltzman constant  
T = Absolute temperature  
B = Band width  
R = Channel resistance of FET (= 1/gm)

Channel resistance R of FET is equal to 1/gm. By this, when FETs are connected in parallel, the total gm becomes higher and S/N ratio is excessively improved.

On AU-919, -154dB of total noise level under equivalent input is obtained. The circuit as shown in Fig. 2-1 uses ICL construction with total six low-noise Dual-FETs per channel (in case of using rank K2 of the FET) in parallel push-pull connection, and Diamond differential DC(DD/DC) circuit with fully push-pull transistor in output stage of the pre-amp section.

2) Phono equalizer circuit is input-capacitor-less (ICL) direct coupled DC equalizer amp employing DD/DC circuit. The output impedance on this circuit is as low as 200 ohms, S/N ratio better than 90dB and the deviation of RIAA equalization curve within  $\pm 0.2\%$ . In addition, the slew rate of the equalization circuit itself is excessively high, 200V/ $\mu$ sec.

The circuit configuration of pre-amp section as shown in Fig. 2-1 is that the first stage is differential input circuit of Dual-FET with cascode-connected bootstrap, and high performance constant current circuit to avoid tonal coloration, phase shift and external noise, and second and third stage include DD/DC circuit with high driving capability. The output stage is composed of Darlington-connected SEPP circuit.

The features of the constant current circuit and the bootstrap circuit are simply explained below, description of DD/DC circuit is on the next page.

\* Constant Current Circuit

Common mode rejection ratio and power supply rejection ratio, as an advantage of differential amplifier, can be more improved by adding the constant current circuit.

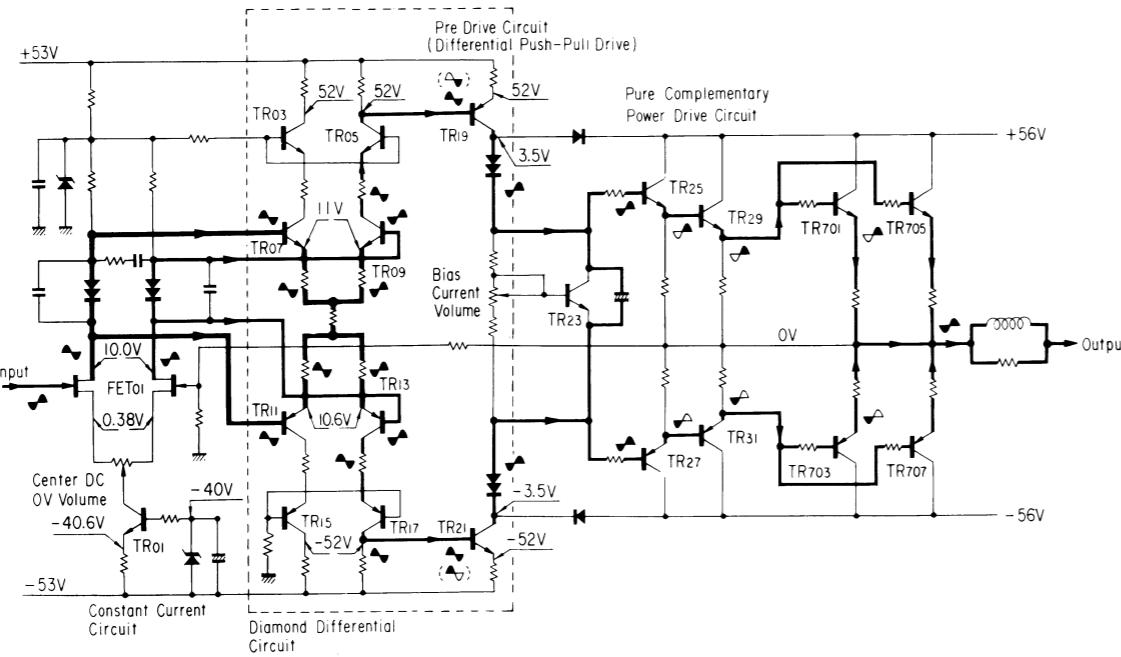

\* Cascode bootstrap circuit

This circuit allows the following features as differential amplifier using low-noise Dual-FET.

1. Gate leak current is almost ignored by making voltage between Drain and Source of FET low.
2. As mirror effect is decreased, the frequency response of high range is more extended.
3. The distortion caused by voltage dependence of negative feedback capacitance is decreased.
4. Linear response can be highly improved.

## 2-2. Operation and Features of Diamond Differential DC(DD/DC) Circuit

Fig. 2-2

**• Operation and Features of Diamond Differential DC(DD/DC) Circuit (Refer to Fig. 2-2)**

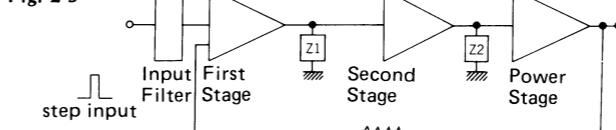

1. Features

- 1) The DD/DC circuit has been developed based on Sansui's latest electronic technology and our sound policy which have been living in our tradition since a series of Sansui AU-517 & AU-717. That is, the performance of this AU-919 is positively pursued and improved in dynamic characteristics as well as in static characteristics.
- 2) By improving open-loop characteristics to perform NFB properly and providing sufficient current margin for this circuit, TIM (Transient Intermodulation) distortion has been able to be reduced.

2. NFB and TIM distortion

As shown in Fig. 2-3, in a conventional power amplifier, an NF signal delays due to time constant of impedance element, and is operated with an input signal. As by this lagging, the phase of NF signal does not coincide with that of input signal, it is not possible to feed back the signal instantaneously containing transient components such as music with various harmonics. As a result, it brings TIM distortion which the waveform of output signal clips instantaneously. For this reason, the input signal can not be purely amplified and distortion is incurred.

Fig. 2-3

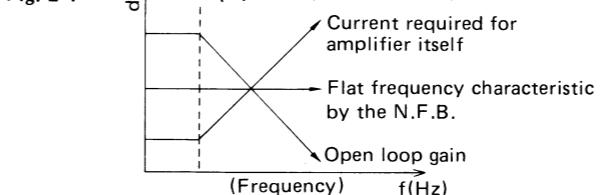

Taking into consideration on TIM distortion and NFB, they are essential for enhancement of better sound quality in dynamic characteristics, also NFB is very effective for following points.

- 1) Improvement of non-linear distortion.
- 2) Stabilization of gain against temperature drift, caused by current-flows, and fluctuation of power source voltage.
- 3) Reduction of amplifier noise.
- 4) Improvement of input and output impedance.

On the other hand, Fig. 2-4 below shows the change of the required current to provide NFB. This Fig. shows that it is necessary to increase the required current in order to increase the NFB and that the more open-loop characteristics becomes narrow, the more the required current becomes large. This means that if ample current margin is not available, TIM distortion will be arisen.

Fig. 2-4

3. Prevention of TIM distortion

The prevention methods of TIM distortion are as follows:

- 1) To minimize NFB amount
- 2) To apply local feedback to the voltage amplification stage in order to improve main feedback.
- 3) To apply current as much as possible into the voltage amplification stage.
- 4) To connect a filter so that a transient input signal does not enter into the input stage beyond response of the amplifier.
- 5) To adopt an input capacitor providing lagging-phase in addition to the conventional mirror type circuit, in order to achieve 2-pole phase compensation, and at the same time, to enhance the stability by carrying out leading-phase compensation.

This AU-919 adopts the abovementioned methods 1) to 5), also the DD/DC circuit is designed to achieve the subject above item 3). As shown in Fig.2-3, when figuring out current values required for each voltage amplification stage of the amplifier, assumig that the most severe input (an input which is large enough to operate the amplifier and contains infinite frequency componnets) is applied to the amplifier, it is found that large current is required for second and its following stages of this section. Therefore, AU-919 includes the DD/DC circuit to prevent annoying TIM distortion.

4. Operation of Diamond Differential DC Circuit for Large Current Drive

- \* DD/DC circuit which is one of methods to prevent TIM distortion can supply an amplifier itself with large current required.

- 1) Fig. 2-7 shows the fundamental circuit of DD/DC section. The voltage differential circuit consists of TR07 and TR09 as well as TR11 and TR13, On the other hand, the current differential circuit consists of TR07 and TR13 as well as TR09 and TR11.

Fig. 2-5 Current Differential Circuit

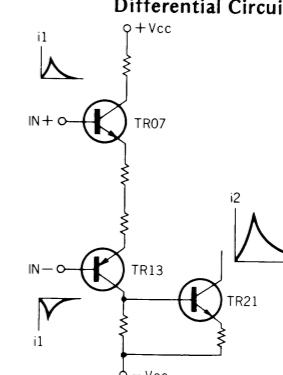

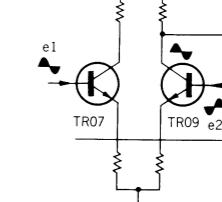

Fig. 2-6 Voltage Differential Circuit

\* In the above Fig.2-7, the cascode-connected Circuit consisting of TR03, TR05, TR15 and TR17 is omitted.

Fig. 2-5 shows the current differential circuit.

Fig. 2-6 shows the voltage differential circuit.

In Fig. 2-7, TR07 and TR09 as well as TR11 and TR13 perform voltage differential amplification under an audible signal frequency band. When signals including transient or high frequency components is applied to input in Fig. 2-5, the operation of this stage shifts from voltage differential amplification to current differential amplification consisting of TR07 and TR13 as well as of TR09 and TR11, which let the large current flow into this stage. Above function results the improvements of rise-time and slew rate, in other word, it brings the reduction of TIM distortion.

- 2) The detailed operation of the current differential circuit is as follows:  
The complementary circuit in Fig.2-5 consists of TR07 and TR13 and two input signals into these TR07 and TR13 are anti-phase each other, therefore, only when a transient signal including positive (+) side component into TR07 and negative (-) side into TR13 is applied to the inputs, the circuit functions and outputs only half wave with large amount of current each other from two outputs. TR09 and TR11 perform the similar function in Fig.2-7, and the output signals are out-of-phase each other with half wave, so that TR19 and TR21 in next stage operate as a push-pull function and large current is able to be flowed.

### 3. ADJUSTMENTS

**Notes:**

1. Level Volume . . . . . Minimum
2. Room Temperature . . . . .  $18^{\circ}\text{C} \sim 28^{\circ}\text{C}$   
( $65^{\circ}\text{F} \sim 83^{\circ}\text{F}$ )

3. When replacing some parts or circuit board, refer to description in REMARKS.
4. For this adjustment, run the unit for more than 3 minutes after the power is switched ON.

#### 3-1. MC Head Amp (F-2833) Adjustment (See Fig. 3-1 & 3-4)

STEP	SUBJECT	MEASURE OUTPUT	ADJUST	ADJUST FOR	REMARKS
1	Voltage Adj. L-ch + side	Between chassis (GND) and one of Drains of FET01, FET03, FET05, FET07, FET09, FET11 (between GND and (A) in Fig. 3-1) Each Drain of all FETs (2SK163) commonly connected.	VR03 (L-ch) F-2833	+10V ±1V	Before turning ON power switch, set VR01, VR05, VR03 (R-ch) and VR04, VR06, VR02 (L-ch) to center position.
2	R-ch + side	Between chassis (GND) and one of Drains of FET02, FET04, FET06, FET08, FET10, FET12 (between GND and (B) in Fig. 3-1)	VR04 (R-ch) F-2833		
3	L-ch - side	Between chassis (GND) and one of Drains of FET13, FET15, FET17, FET19, FET21, FET23 (between GND and (C) in Fig. 3-1) Each Drain of all FETs (2SJ44) commonly connected.	VR05 (L-ch) F-2833	-10V ±1V	
4	R-ch - side	Between chassis (GND) and one of Drains of FET14, FET16, FET18, FET20, FET22, FET24 (between GND and (D) in Fig. 3-1)	VR06 (R-ch) F-2833		
5	Balance adj. in case of using distortion meter	VR01 (L-ch) VR02 (R-ch) F-2833	Minimum distortion		<ul style="list-style-type: none"> <li>• Feed sine-wave signal, 1 kHz to PHONO-1</li> <li>• Refer to notes below.</li> </ul>

**Notes:** Balance adj. in step 5 with distortion meter

- 1) Feed sine-wave signal, 1 kHz to PHONO-1.
- 2) Connect distortion meter to TAPE-REC input terminal and set output level of TAPE-REC to 20 volts by adjusting audio oscillator output.
- 3) Add 10 ohms, 1/4W, across output terminal of audio oscillator to have impedance matching.

Balance adj. without distortion meter

- 1) VR01 . . . Set VR01 to 2/3 position from max. point.
- 2) VR02 . . . Set VR02 to 2/3 position from min. point.

#### 3-2. Equalizer (F-2835) Adjustment (See Fig. 3-2)

STEP	SUBJECT	MEASURE OUTPUT	ADJUST	ADJUST FOR	REMARKS
1	DC0V Adj.	Between GND & common joint of R67, R69 (between GND and (E))	VR01 (L-ch) F-2835	DC 0V ±50 mV	Before turning ON power switch, set VR01 & VR02 to center position.
2	DC0V Adj.	Between GND & common joint of R68, R70	VR02 (R-ch) F-2835		

#### 3-3. Flat Amp (F-2841) Adjustment (See Fig. 3-5)

STEP	SUBJECT	MEASURE OUTPUT	ADJUST	ADJUST FOR	REMARKS
1	DC0V Adj.	Between GND & TEST POINT from emitter of TR13 through R43 (TEST POINT between $\oplus$ & $\ominus$ in Fig. 3-5)	VR01 (L-ch) F-2841	DC 0V ±10 mV	Before turning ON power switch, set VR01 & VR02 to center position.
2	DC0V Adj.	Between GND & TEST POINT from emitter of TR14 through R44 (TEST POINT between $\oplus$ & $\ominus$ in Fig. 3-5)	VR02 (R-ch) F-2841		

#### 3-4. Driver Circuit (F-2839) Adjustment (See Fig. 3-3/3-4)

STEP	SUBJECT	MEASURE OUTPUT	ADJUST	ADJUST FOR	REMARKS
1	DC 0V Adj. (see Fig. 3-3)	Speaker terminal (L-ch)	VR01 (L-ch) F-2839	DC 0V ±5 mV	Before turning ON power switch, set VR01 & VR02 to center position.
2	DC 0V Adj. (see Fig. 3-3)	Speaker terminal (R-ch)	VR02 (R-ch) F-2839		
3	Bias current Adj.	Between emitters of power transistors TR707 & TR705 (between (C) & (H) in Fig. 3-4)	VR03 (L-ch) F-2839	DC 20 mV ±1 mV	• Before turning ON power switch, turn VR03 & VR04 fully counter-clockwise. This bias current adjustment converts current value into voltage by Ohm's law.
4	Bias current Adj.	Between emitters of power transistors TR706 & TR708 (between (I) & (H) in Fig. 3-4)	VR04 (R-ch) F-2839

#### 4-7. F-2844 Power Supply Circuit Board for pre-amp section (Stock No. 7503001)

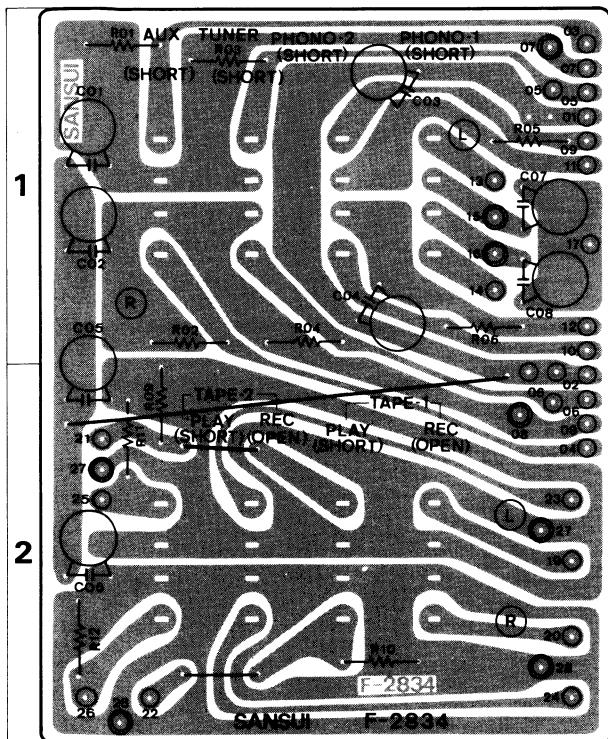

Conductor Side

Note: The circuit boards, F-2834, F-2846, F-2838, F-2842, F-2843, F-2837, F-2928 & F-2836 are not supplied as the assembled, the individual parts on the circuit board, however, are provided for orders.

#### 4-8. F-2834 Input Terminal Circuit Board

Conductor Side

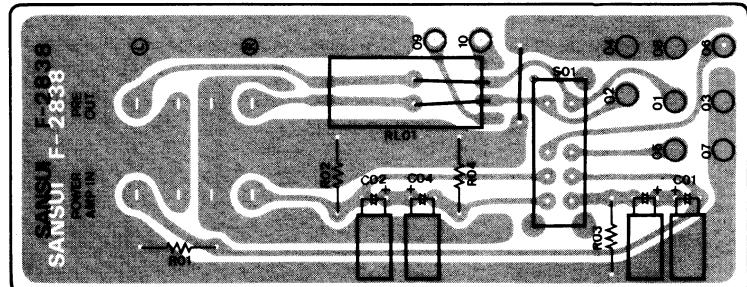

#### Parts List

Parts No.	Stock No.	Description	Position
R 01, 02	0280105	1MΩ 1/3W C.R.	1
R 03, 04	0280105	1MΩ 1/3W C.R.	1
R 07, 08	0280104	100kΩ 1/3W C.R.	
R 09, 10	0280105	1MΩ 1/3W C.R.	2
R 11, 12	0280105	1MΩ 1/3W C.R.	2
	2200620	4P Input Terminal (TUNER, AUX)	
	2200630	4P Input Terminal (PHONO-1, 2)	
	2200650	4P Input Terminal (TAPE-1, 2)	

#### 4-9. F-2838 Circuit Board between Pre & Main amp

Conductor Side

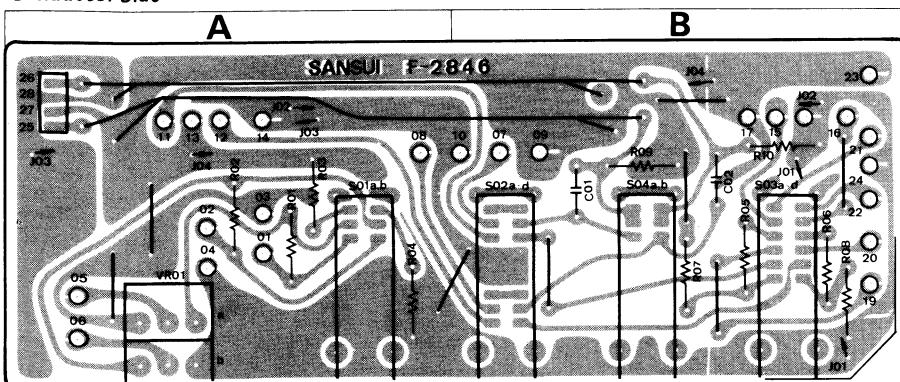

#### Parts List

Parts No.	Stock No.	Description
C 01, 02	0515100	10μF 50V E.C.
C 03, 04	0515100	10μF 50V E.C.
R 01, 02	0280105	1MΩ 1/3W C.R.
R 03, 04	0280105	1MΩ 1/3W C.R.
RL01	1150430	Relay
S 01	1110290	Slide Switch, Connected/Separated
	2200650	4P Input Terminal (PRE AMP, POWER AMP)

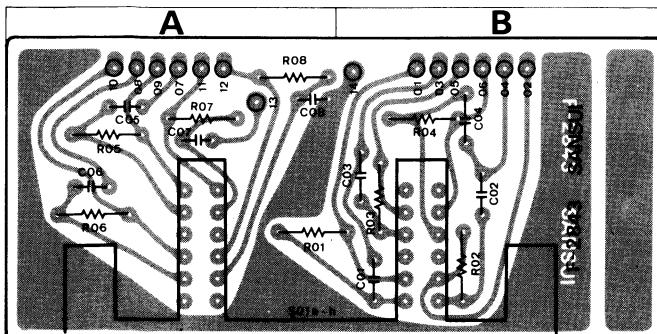

#### 4-10. F-2846 Muting, Jump, Tone Defeat Circuit Board

Conductor Side

#### 4-12. F-2843 Turn-over Circuit Board

Conductor Side

##### Parts List

Parts No.	Stock No.	Description	Position
C 01, 02	0680051	0.12μF 100V M.C.	B
C 03, 04	0680058	0.24μF 100V M.C.	B

## 6. REPLACEMENTS & REPAIR NOTES

### 6-1. Power Supply Circuit Board, F-2844 for pre-amp section(refer to pictures on page 9. 10)

- 1) Remove bottom plate 15
- 2) Take off a screw for installing F-2844
- 3) The circuit board, F-2844 can be easily off by detaching double-faced adhesive tape just on the back of point(A).

### 2. Power Supply Circuit Board, F-2845 for power amp section

- 1) Take off 8 screws (b, c, d, e, f, g, h, i) fixing the taps of electrolytic capacitors of C705, C703, C704, C706 with the circuit board.
- 2) Disconnect a grey wire soldered only on GND lag, (j).
- 3) Plug out two orange wires from plug socket, "k", on the circuit board.

### 3. Protector Circuit Board, F-2840 and Rectifier Circuit Board, F-2928

- 1) Remove bottom plate first.
- 2) Take off 5 screws (l, m) for installing the rear panel and the panel will be easily off.
- 3) Then take off 4 screws (n, o) installing F-2840 board, and the F-2840 with F-2928 board can be off, (The board, F-2840, can be separated from F-2928 by removing two screws, (p). )

### 4. Power transistors

- 1) Remove bottom plate.
- 2) Take 4 screws (q, r, s, t) off for installing heat sink and disconnect wires (u, v), then pull the heat sink out of bottom side.

### 6-2. Repair notes

- 1) Turn level volume down or power switch off, when inserting or disconnecting shilded cable with plug into/out of input terminals on rear panel of AU-919.  
Otherwise, power driver transistor (s) or speaker would be defective due to clicks occured by the contact inside the famale plug.
  - 2) If you replace the defective power transistor (s), check all other transistors on driver amp circuit board, F-2839.
  - 3) When dismounting heat sink, check or repair of equalizer amp circuit board, F-2835 can be made, as the circuit board is holded with heat sink together by two screws.
  - 4) There are six kinds of ranks (K2, L1, L2, M1, M2, N) of both FETs, 2SK163 and 2SJ44 respectively on MC head amp circuit board, F-2833, and the circuitry on the board is parallel-connected complementary arrangement using PNP (2SK163) and NPN type (2SJ44) FET.  
When you replace either 2SK163 or 2SJ44, please note the following instructions referring to the list on page 3
    1. Use same rank of all FETs on one channel.
    2. Each rank of FET determines the total gain in quantity per one channel, therefore, total quantity of FET on one channel is dependent upon the rank, due to slightly different gm. even in the same name FET.
- \* As to total quantities of 2SK163 and 2SJ44 per one channel, refer to the list on page 3.

## 7. NOTES / When using external system selector for switching audio components—receivers, amplifiers, decks and loudspeakers, etc.

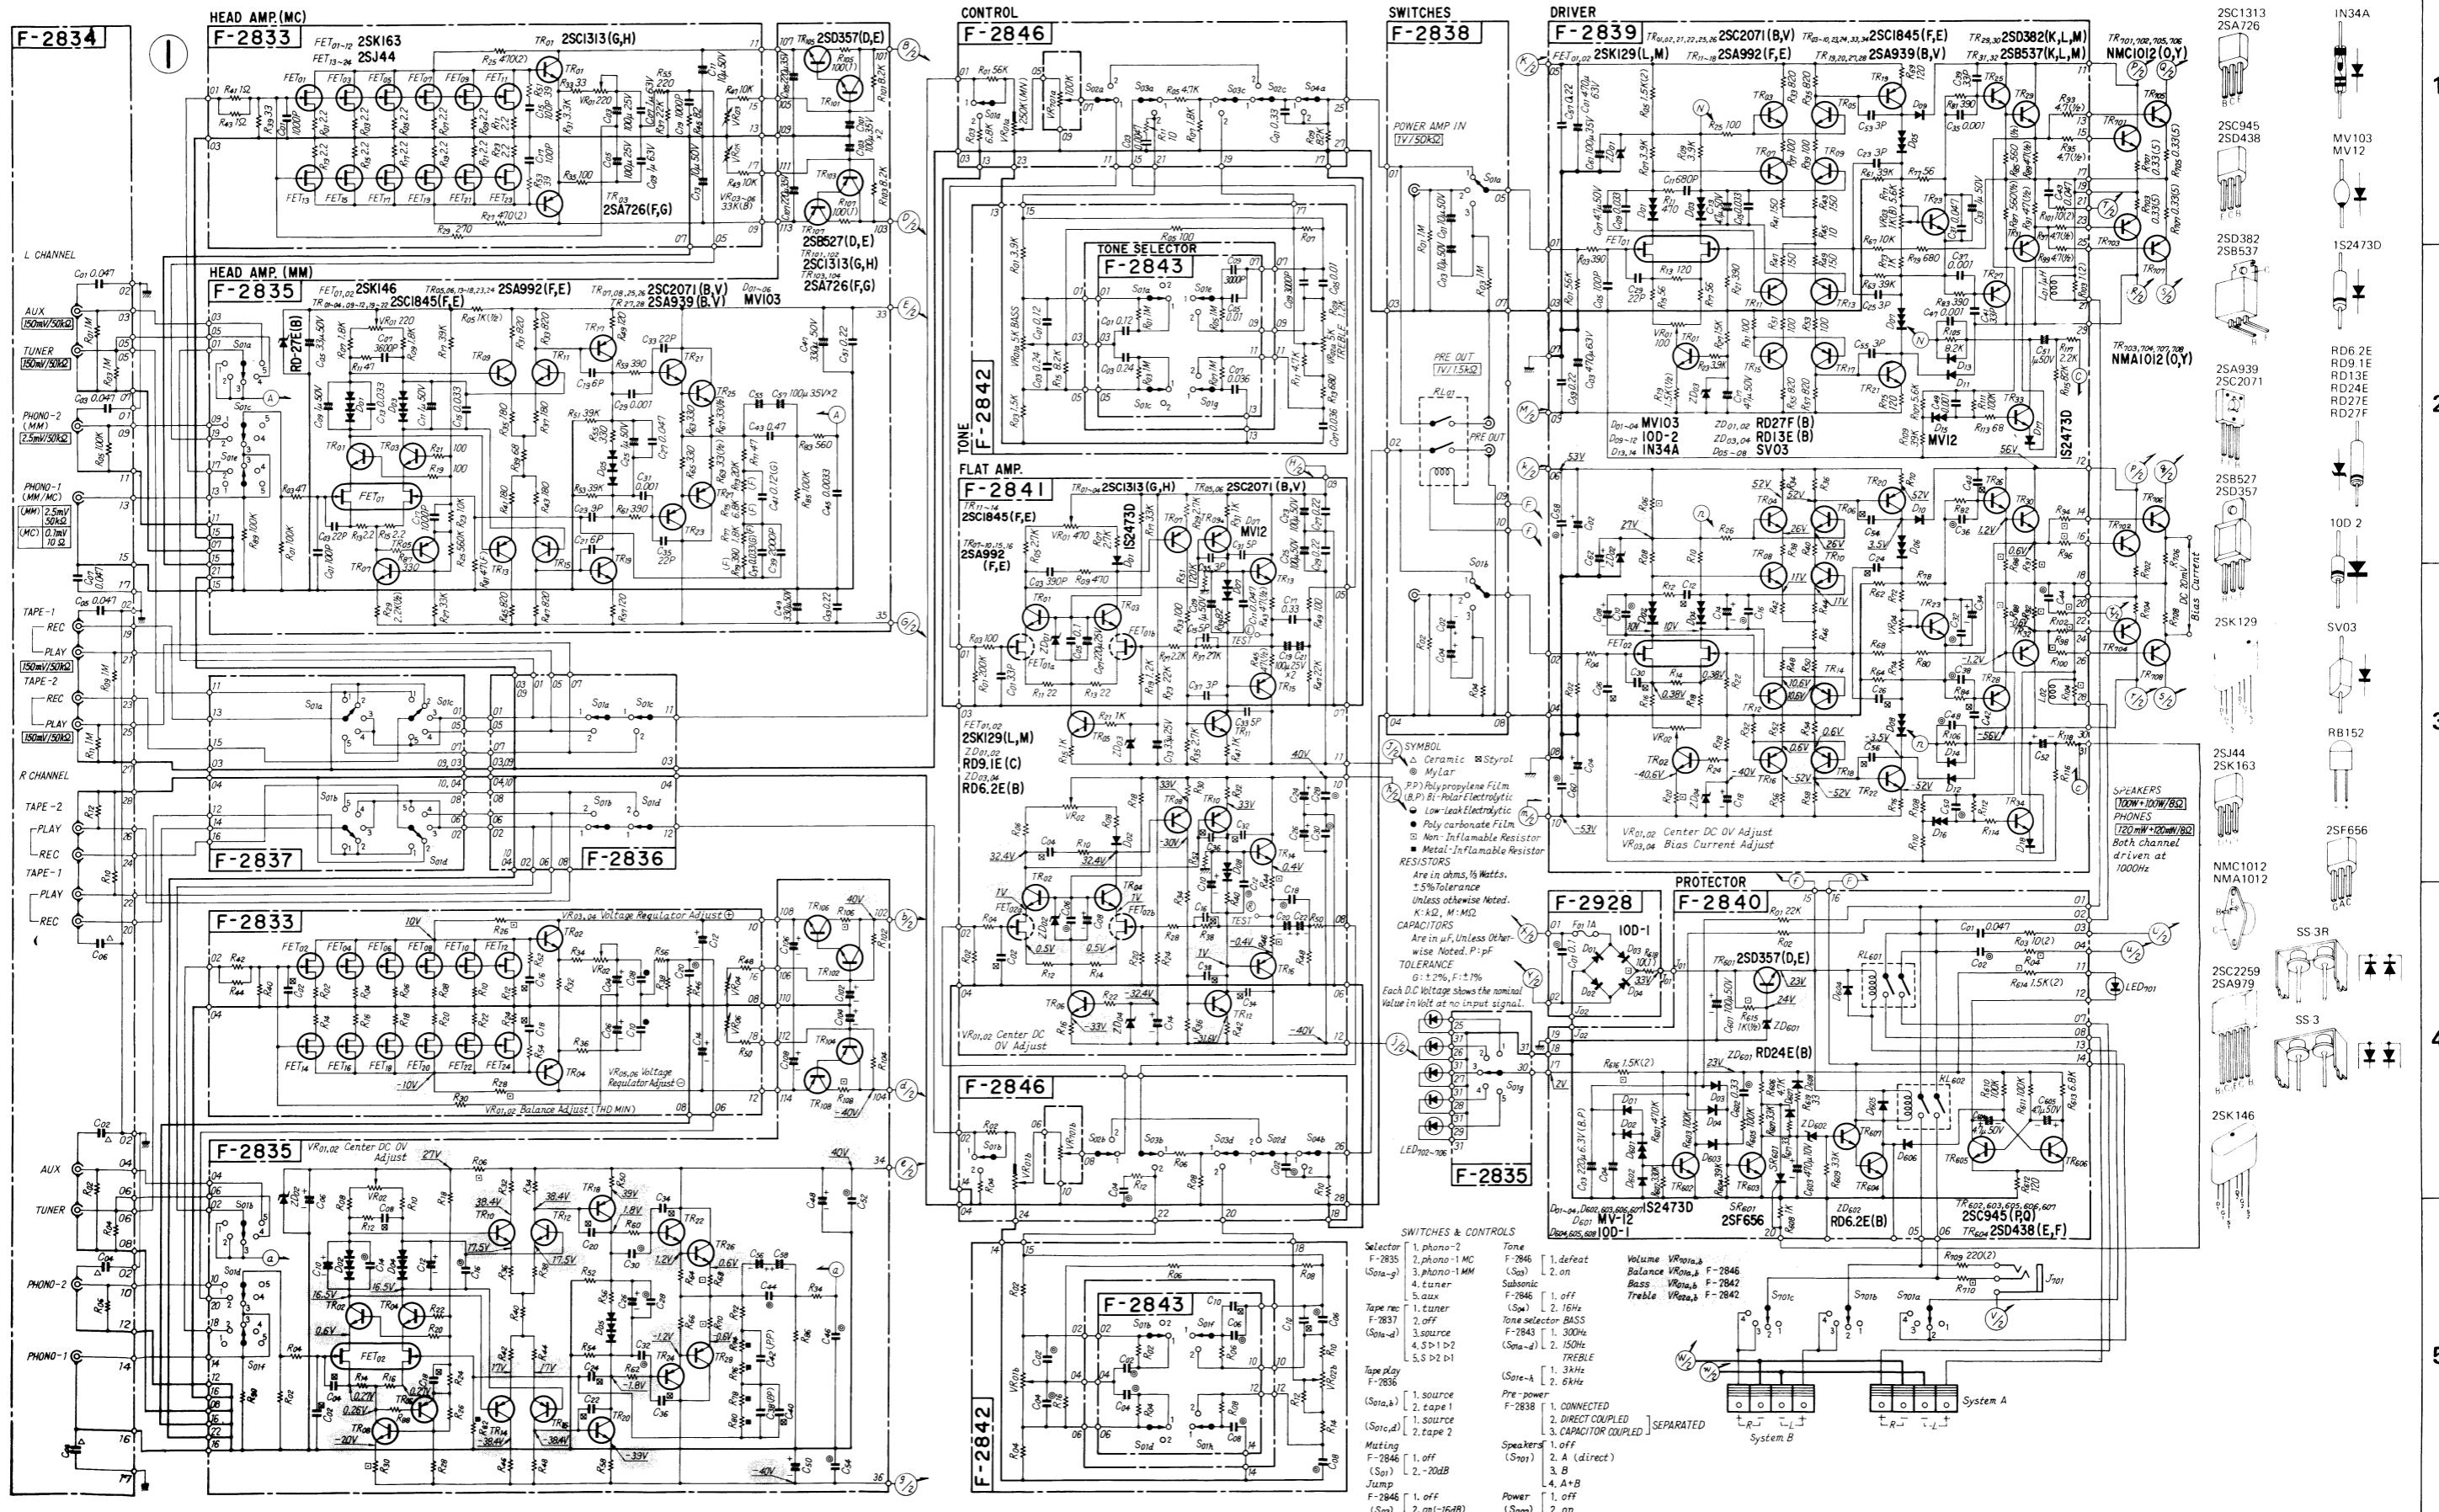

Please consider the following notes when using the external system selector with this AU-919 having wide-spread frequency range extended to 500 kHz and high slew rate, 200V/ $\mu$ sec.

- 1) To avoid hum-noise, blow of power or driver transistors, connect firmly an earth wire between turntable, the external system selector and this AU-919.

- 2) Do not connect earth wire commonly between outer shielded side (GND) of pin cord (or outer side of famale pin plug of input terminal of AU-919) and GND terminal(s) of the system selector.
- 3) After the above connection, confirm that oscillation noise or annoying noise dose not come from loudspeakers, if possible, that additionally it does not make oscillation through wide bandwidth 10 MHz or more oscilloscope.
