CIRCUIT DESCRIPTION

1. BASIC CIRCUIT

The circuitry of this control amplifier is based on a complementary—symmetrical, push-pull amplification system that is powered by positive, negative dual power supplies. Fig. 1 illustrates its basic principle. Q1 and Q2 comprise a NPN type differential amplifier system while Q4 and Q5 form, a PNP type differential amplifier. This circuit has numerous advantageous features including high gain, good thermal stability and low distortion amplification due to the ease in applying stabilized negative feedback.

Q3 and Q6 are common emitter amplifiers that respectively constitute constant current loads that enable high stability amplification.

Circuits that require wide dynamic range and low output impedance such as equalizer and headphone amplifiers are all further connected into complementary-symmetry stages.

In servicing a C-200, bear in mind that —

- a. All circuits within a circuit block are direct coupled.
- . Gain is determined by Z1 and Z2 (Negative Feedback loop).
- c. Circuits such as equalizer amplifier and tone control which control frequency response do so by varying the frequency response characteristics of Z1 and Z2. Since Z2 is not grounded in terms of DC in almost all circuits, direct current becomes 100% NF. As a result, the electric potential of the output stage collector never exceeds ± 50 mV DC.

2. EQUALIZER AMPLIFIER

The equalizer amplifier consists of the basic circuit shown in Fig. 1 to which connected are two stages of complementary—symmetry amplification. A high DC voltage of ± 60 V is applied to them to permit handling dynamic range inputs as large as 400mV with distortion confined to less than 0.1% at 1 kHz.

- a. ± 23 V is applied to the basic circuit section.
- b. Q11 and Q12 serve to stabilize the power source. This stage gains the above ± 23 V and increase the stability of the power source as well.
- c. D1, D2, D3 and D4 are heat compensating diodes that serve to stabilize the collector current in the output stage.
- d. The gain (40dB at 1kHz) and frequency response characteristics of this circuit are determined by the Negative Feedback (NF) Loop (Fig. 2). The tolerances of all main resistors and capacitors therein have been kept rigidly within $\pm 1\%$, permitting close adherence to the RIAA standard equalization curve within ± 0.2 dB from 20Hz to 20,000Hz.
- e. Subsonic vibrations of phono motors can cause inter modulation distortion and harm disc reproduction quality. The following circuit design has been adopted in this amplifier to prevent this.
- * 6dB/oct attenuation is applied to all frequencies below 9Hz. This is achieved by the time constants of C1 and C7 in the Z2 section.
- * In addition, a subsonic filter is built-in which permits cut-off of subsonic frequencies. (Switching C1 in or out by means of S3). The cut-off point of this filter is 25Hz.

3. TONE CONTROL CIRCUIT AND ITS SURROUNDINGS

The basic circuit in Fig. 1 is used. Tone control is achieved by varying Z_1 and Z_2 as previously pointed out.

a. DURING FLAT RESPONSE OR TONE CONTROL SWITCH AT OFF.

R_3 and R_4 of $10\text{ k}\Omega$ shown in the schematic diagram in page 19 and 20 constitute Z_1 and R_5 and R_6 of $1\text{ k}\Omega$, Z_2 . For reference sake the gain at this time is

$$\text{Gain} = 20 \log \frac{Z_1 + Z_2}{Z_2} = 20 \log \frac{11\text{ k}\Omega}{1\text{ k}\Omega} = 20 \text{ (dB)}$$

b. LOW BOOST

An abbreviated schematic for low boost circuit in the NF loop is shown in Fig. 3 (A). The low boost curve is obtained by changing the values of R_3 and C_1 by means of a rotary switch. R_3 here represents R_6 to R_{10} within the Bass control switch assembly No. 716-0001-00, and C_1 here represents C_{13} , and C_{20} to C_{24} . This applies only, however, when the TURN-OVER switch is at 400 Hz . When this switch is at 200 Hz , C_{14} to C_{17} are further connected into the circuit in parallel.

c. LOW CUT

Fig. 3 (B) briefly illustrates this low-cut circuit in the NF loop in which the low-cut curve is obtained by varying the values of R_4 and C_2 . As explained above, R_4 here represents R_1 to R_5 and C_2 here represents C_7 to C_{12} . With turnover at 200 Hz , C_1 to C_6 are further connected into the circuit in parallel.

d. HIGH BOOST

Fig. 3 (C) shows the representative circuit in the NF loop for high boost, the curve for which is obtained by varying the values of R_5 and R_6 . R_5 and R_6 in this abbreviated schematic represents R_{17} , R_{19} , R_{21} , R_{23} , R_{25} , R_{27} , R_{37} , R_{39} , R_{41} , R_{43} , R_{45} and R_{47} .

Turnover is accomplished by fixing the C_3 value beforehand with 2 capacitors connected in parallel for 2.5 kHz turnover, and one being cut off for 5 kHz turnover. C_3 in this abbreviated schematic represents C_9 and C_{11} .

e. HIGH CUT

Fig. 3 (D) shows the representative circuit in the NF loop for high cut, the curve for which is obtained by varying the values of R_7 and R_8 . R_7 and R_8 in this abbreviated schematic represents R_{37} , R_{39} , R_{41} , R_{43} , R_{45} , and R_{47} . Turnover is accomplished by fixing the C_4 value beforehand with 2 capacitors connected in parallel for 2.5 kHz turnover, and one being cut off for 5 kHz turnover. C_4 in this abbreviated schematic represents C_{13} and C_{15} .

Note: $330\text{ k}\Omega$ or $470\text{ k}\Omega$ resistors are connected in parallel with some of the above capacitors in order to prevent click noises during switching.

4. FILTER AND SURROUNDING CIRCUITS

a. FILTER CIRCUIT

Since gain is not necessary here, this circuit differs from the basic circuit and employs a complementary-symmetrical connection to incorporating, PNP and NPN type emitter follower circuits respectively. Low distortion and high stability are ensured through ingenious utilization of the mutual compensating characteristics. This circuit is by-passed when the filter is switched OFF.

b. OUTPUT CIRCUIT

This circuit also requires no gain and therefore employs an emitter follower a complementary-symmetrical connection, which further utilizes Darlington coupling to ensure a low output impedance.

5. HEADPHONE AMPLIFIER

The final stage in the basic circuit of this amplifier circuit is a real output amplifier, which employs a complementary symmetrical amplification equivalent to a main amplifier in every respect. Moreover, it is an output capacitor less type and possesses a damping factor of more than 50 against an 8 ohm load.

6. CONSTANT VOLTAGE POWER SUPPLY CIRCUIT

The positive side sets the standard for this dual power supply system with the negative side conforming to it. Therefore, plus and minus levels are always identical and cancel out pulse rise and fall values during ON-OFF switching and the consequent "shock" noise that otherwise would occur with switching. The output voltage of the high voltage side is 60 — 65V and that of the low voltage side is 30V, which is suppressed from the 60V. D-7, R7 and R9 determine the output voltage preciseness of the positive side, while R8 and R10 determine that of the negative side. These resistors therefore become natural check points when troubleshooting abnormal power supply voltages.

7. OTHER AUXILIARY CIRCUITS

a. PREVENTION RESIDUAL OUTPUT

Large capacity condensers are used in the power supply circuits. As a result, there is a lapse of time after power is turned OFF before these capacitors are fully discharged. This results in an undesirable residual output after AC is switched off.

To prevent this, this unit is equipped with a relay in the signal circuit which opens the circuit when power is turned off.

This reed relay is located on a printed-circuit board which is equipped with a push-button switch.

b. POWER SUPPLY PROTECTION

A Slow-Blow type fuse which is unaffected by initial "rush" currents is employed in the primary side of the power transformer. Since temporary current surges such as initial "rush" currents can cause ordinary type fuses to blow, it is general practice with such fuses to adopt a rating that is considerably higher than the normal current flow. This, of course, reduces the protective function of a fuse, so a slow-blow fuse has been employed in this amplifier to increase the safety factor.

On the other hand, a short circuit may occur in the power transformer secondary circuit (such as the pilot lamp circuit) which may not cause the fuse on the primary side to blow. Therefore, a fuse is also inserted in the secondary circuit to counteract this possibility and prevent the transformer from overheating. This fuse is mounted on a printed circuit board located in the chassis interior. Check this fuse in case of the following indications:

- * Indicator lamps fail to light although all other operations are normal.
- * Output is unavailable at the headphone jack only.
- * No output. No reed relay clicking, though very weak, sounds when the power switch is turned ON and OFF.

EQUALIZER AMP. ASSEMBLY (711-0001-00)

PRINTED CIRCUIT BOARD

*Printed circuit board as seen from the reverse side.

Use of transistors other than specified will adversely affect performance and should be avoided.

THE MARK OF CAPACITOR AND RESISTORS ON THE SCHEMATIC DIAGRAM

- : CERAMIC CAPACITORS
- ⊖: MICA CAPACITORS
- ⊗: TANTALUM SOLID CAPACITORS
- : METALLIZED FILM CAPACITOR
- ⊕: POLYSTYRENE FILM CAPACITORS
- ⊙: MYLAR FILM CAPACITORS

- : METAL FILM RESISTORS
 - : OXED METAL FILM RESISTORS
 - ⊞: CEMENT COATED WIRE WOUND RESISTORS
 - ▣: CEMENT COATED METAL PLATE RESISTORS
- Unless other wise specified: Capacitors are ELECTROLYT-IC Types: Resistors are CARBON FILM Types, 1/2 watt, and ±5% tolerance;

Indicated values of parts in the schematic diagram may be changed in case of performance improvement.

This is the new Schematic Diagram as of July, 1976.
Please note that it includes slight changes from the Printed Board pattern and Parts List which appear in the foregoing pages.

C-200 REVISED SCHEMATIC DIAGRAM

This is t
Please 1

Please note that it includes slight changes from the Printed Board pattern and Parts List which appear in the foregoing pages.

SPECIFICATIONS

PERFORMANCE GUARANTY:

Products of Kensonic guarantee specifications stated.

FREQUENCY RESPONSE:

High level input: +0, — 0.2 dB 20 Hz to 20,000 Hz
Low level input: +0.2 — 0.2 dB 20 Hz to 20,000 Hz

DISTORTION:

Lower than 0.05% at rated output level, 20 Hz to 20,000 Hz.

INPUT SENSITIVITY AND IMPEDANCE:

Disc 1	2 — 6 mV*	20 K ohms, 30 K ohms, 47 K ohms.
Disc 2	2 — 6 mV*	47 K ohms.
Mic	2 mV	47 K ohms.
Tuner	200 mV	130 K ohms.
Aux 1, 2, FRONT	200 mV	130 K ohms.
Tape Play 1, 2, FRONT	200 mV	130 K ohms.

(* 2—6 mV changeable)

MAXIMUM INPUT FOR DISC INPUT:

400 mVrms at level control maximum (equalizer gain 40 dB) for 1 kHz.
1.2 Vrms at level control minimum (equalizer gain 30 dB) for 1 kHz.
at 1 kHz 0.05% distortion

OUTPUT LEVEL AND IMPEDANCE:

Main Output	2.0 V*	200 ohms.
Headphones	0.4 V*	0.3 ohms.
Tape Rec. 1, 2, FRONT	200 mV	200 ohms.

(* at rated input, volume control maximum)

MAXIMUM OUTPUT LEVEL:

10 Volts at 0.05% distortion.

VOLTAGE AMPLIFICATION IN DECIBELS:

Tuner, Aux, Tape Play input:

to Main Output	20 dB.
to Tape Rec.	0 dB.
to Headphones	6 dB.

Disc 1, Disc 2, and Mic Input (at 1 kHz):

to Main Output	60 dB.
to Tape Rec.	40 dB.
to Headphones	46 dB.

HUM AND NOISE:

Tuner, Aux, Tape Play: 90 dB below rated output.
Disc, Mic: 74 dB below 10 mV input, 64 dB below rated input.

TONE CONTROLS:

11 Position Rotary Switch for each channel with turnover frequency switches.

BASS:

Turnover frequency 400 Hz: ±10 dB (2 dB step) at 100 Hz.
Turnover frequency 200 Hz: ±10 dB (2 dB step) at 50 Hz.

TREBLE:

Turnover frequency 2,500 Hz: ±10 dB (2 dB step) at 10,000 Hz.
Turnover frequency 5,000 Hz: ±10 dB (2 dB step) at 20,000 Hz.

DISC LOW ENHANCEMENT (for Disc input):

0 dB, +0.5 dB, +1 dB at 100 Hz to RIAA standard characteristics.
Bass tone becomes richer and more natural when switched to +0.5 dB or +1 dB.

COMPENSATOR:

ON position boosts low frequencies for low level listening.
+9 dB at 50 Hz (at volume control —30 dB)

FILTERS:

Disc Subsonic Filter:	25 Hz cutoff	6 dB/oct.
Low Filter:	30 Hz cutoff	18 dB/oct.
High Filter:	5,000 Hz cutoff	12 dB/oct.

VOLUME CONTROL:

Less than ±1 dB tracking error control at all listening levels.

POWER REQUIREMENT:

Voltage selector for 100V, 117V, 220V, 240V 50/60 Hz operation.
Consumption: 36 Watts.

SEMICONDUCTOR COMPLEMENT:

80 Transistors, 35 Diodes.

DIMENSIONS:

17½ inches (445 mm) wide, by 6 inches (152 mm) high, 14 inches 355 mm) deep.

WEIGHT:

30.8 pounds (14 kgr.) net, 40.6 pounds (18.3 kgr.) in shipping carton.
